Debbie,

Thanks for the e-mail. I was out doing RCRA inspections in Maryland and Morgantown.

I looked at the pictures. The first thing with pumps is the pump usually is set up nearest to what it will be pumping. I can't tell if it is connected to the manifold. It appears that it might be. After zooming into the pump itself, it looks like longer line running from the pump and is laid around the impoundment is set up to discharge to the impoundment. The pump doesn't appear to be set up to draw water from that line.

The best that I can tell is that they might be simply recirculating the water within the impoundment. I can't tell if they are adding any biocides. With the heat and stagnate conditions, I wouldn't be surprised if the impoundment was smelly.
Jim

Hi Jim

Any thoughts on what you think they maybe pumping into the Carter Impoundment??

Hi Debbie,

I have a question... I'm curious to know what the green pump is for that is sitting by the manifolds. As you can see from the photos there is pipe running from it and going around the impoundment and entering on the side where Kim lives. They can't be using it to circulate the water because the water level is too low. Are they using the pump for chemical treatment because the water is stagnant and septic? It obvious that it's being used to pump something in and not out because of the water level.

Janet
